

Improper selection or use of couplings can result in personal injury, property damage and even death. Thus the following is essential and utmost important:.

- Do not pressurize couplings beyond their rated operating pressure.
- Ensure compatibility of components and seals with the fluid being conveyed.
- Do not disconnect couplings under pressure unless utilizing couplings designed for that purpose.
- Avoid external forces acting on the couplings such as tensile, side loads or vibration
- Do not exceed the lowest pressure rating of any of the components used, when using couplings with other manufacturers' adapters, hoses, etc. Or else rupture, accidental disconnection, premature failure, system damage, leakage of fluids which may be flammable, toxic, at extreme temperatures or otherwise harmful may result.

In all cases of doubt, please do not hesitate to contact us and we will supply you with any questions you might have regarding installation.
